## **CLAIMS**

## What is claimed is:

•	
15-	1. A processor comprising:
2	a first instruction set engine;
3	a second instruction set engine;
4	a mode identifier;
5	a plurality of floating-point registers shared by the first instruction set engine and the
6	second instruction set engine; and
7	a floating-point unit coupled to the floating-point registers, the floating-point unit
8	processing an input responsive to the mode identifier to produce an output
1	2. The processor of Claim 1 wherein the mode identifier is one of a plurality of bits
2	in a processor status register.
1	3. The processor of Claim 1 wherein the floating-point unit comprises:
2	pre-processing hardware to detect if a token exists in the input;
3	an arithmetic unit responsive to the input and the mode identifier; and
4	post-processing hardware to perform a token specific operation if a token exists in the
5	input.
1	4. The processor of Claim 1 wherein the input includes data stored in at least one of

the floating-point registers.

2

- 1 5. The processor of Claim 1 wherein the input may contain a token, wherein the floating-point registers are 82 bits wide, and wherein the token being an 82 bit processor known
- 3 value.
- 1 6. The processor of Claim 3 wherein the token represents a "not a thing value"
- 2 (NaTVal) that defines an unsuccessful speculative load request
- The processor of Claim wherein the floating point registers each comprise:
- 2 a sign bit,
- 3 an exponent; and
- 4 a significand.
  - 8. The processor of Claim 1 wherein the mode identifier indicates whether the processor is in a first mode or a second mode.
- 9. The processor of Claim 1 wherein the mode identifier indicates whether the processor is in a 32 bit word instruction set architecture mode (ISA) or a 64 bit word ISA mode.
- 1 10. A method in a processor comprising:
- fetching an input from at least one of a plurality of floating-point registers;
- detecting whether the Input includes a token;
- 4 if the token is detected in the input, checking what mode the processor is in;
- if the processor is in a first mode, processing the input to render an arithmetic result;
- if the processor is in a second mode, performing a token specific operation; and
- 7 producing an output.

ک این	11. The method of Claim 10 wherein the input is comprised of at least one operand
2	and at least operator; wherein detecting comprises examining the at least one operand to
3	determine whether any of the operands correspond to the token; and wherein checking comprises
4	examining a mode identifier to determine whether the processor is in the first mode or the second
5	mode.
1	12. The method of Claim 10 wherein processing comprises executing at least one
2	operation on the at least one operand according to the at least one operator to achieve a result.
1	3. The method of Claim 10 wherein performing comprises propagating the token;
2	and wherein producing output comprises setting the output to be the token.
1	14. The method of Claim 10 wherein the token represents a "not a thing value"
2	(NaTVal) that defines an unsuccessful speculative load request.
1	The method of Claim 10 wherein checking comprises checking a mode identifier.
1	16. The method of Claim 10 wherein checking comprises checking a mode identifier
2	bit in a processor status register.
1	17. The method of Claim 11 wherein the first mode is a 32 bit word ISA mode and
2	the second mode is a 64 bit word ISA mode.
1	18. A multi-mode processor comprising:
2	a plurality of instruction set engines;
3	a mode identifier;

a plurality of floating-point registers shared by the instruction set engines; and

7

a plurality of floating-point	units coupled to the floating-point registers, the floating-point
units processing an input responsiv	e to the mode identifier.

- 19. A method in a multi-mode processor comprising:
- fetching an input from at least one of a plurality of floating-point registers;
- detecting whether the input includes at least one token of a plurality of tokens;
- 4 if at least one token is detected in the input, checking what mode the processor is in;
- 5 processing the input to render an arithmetic result when the processor is in at least a first
- 6 mode of a plurality of modes; and
  - performing a token specific operation when the processor is in at least a second mode of a
- 8 plurality of modes.
